FUEL ORDER AND DELIVERY MANAGEMENT PLATFORM

Company: BAJ Services

1. PROJECT OVERVIEW

BAJ Services is a company involved in the importation and distribution of petroleum products. As part of its distribution activity, BAJ supplies fuel (mainly gasoil) to industrial clients for use in machines and other industrial operations. These supply points are referred to internally as “points consommateurs.”

Currently, orders are handled manually. The objective of this project is to develop an online platform (website) that allows clients to place fuel orders and allows BAJ to manage orders, deliveries, invoicing, and payment follow-up efficiently.

The platform will have two interfaces:

- a) Client interface
- b) BAJ administrative interface

2. PRODUCTS MANAGED BY THE SYSTEM

The system should support up to three petroleum products.

Example: Product 1 (e.g., Gasoil), product 2, product 3

When placing an order, the client must be able to:

- Select one product
- Select two products
- Or select all three products

Quantities should be expressed in **liters or cubic meters (m³)**

3. CLIENT INTERFACE (CLIENT PORTAL)

Each client company will receive login credentials to access the platform.

Information linked to each client account should include:

- Company name
- Contracted selling price per product
- Payment terms (Immediate / 10 / 15 / 30 days)
- Delivery location(s)

Client Capabilities

Once logged in, the client should be able to:

✓ Place an Order

Orders must be placed at least 48 hours before the desired delivery date.

When placing an order, the client must provide:

- Product(s)
- Quantity (Liters or m³)
- Delivery location
- Preferred delivery date
- Contact person at the delivery site
- Contact phone number

Once the order is submitted:

- The system should send an automatic email notification to BAJ.
- The order should appear in the BAJ dashboard for validation.

✓ View Order Status

Clients should be able to see:

- Pending orders
- Validated orders
- Delivered orders

✓ Receive Notifications

Clients should automatically receive notifications when:

- Their order is validated
- Their order is modified
- Their order is rejected

If BAJ modifies or rejects an order, a note explaining the reason must be included.

Example reasons:

- Payment overdue
- Scheduling constraints

✓ Receive Invoices

Once delivery is completed, the system should:

- Automatically generate an invoice
- Send the invoice to the client via email

The invoice should include: **Client name, product(s); quantity delivered, price per unit, total amount, payment method (Virement or Chèque) and payment deadline based on the client's contract.**

4. BAJ ADMINISTRATIVE INTERFACE

The BAJ team should have a secure administrative dashboard. This interface will allow BAJ to manage all operations.

BAJ Capabilities

✓ View Orders

Orders should appear in a table format showing:

- Client company
- Product ordered
- Quantity
- Delivery location
- Requested delivery date
- Order status

✓ Validate Orders

BAJ should be able to:

- Approve the order
- Modify the delivery date
- Reject the order

If modified or rejected:

- BAJ must write a note explaining the reason
- The client receives an automatic notification email

Example rejection case:

- Client has unpaid invoices

✓ Delivery Confirmation

After delivery is completed:

- BAJ confirms delivery in the system
- The system automatically generates and sends the invoice

✓ Payment Follow-Up

Payments will be confirmed manually by BAJ.

The system should track:

- Paid invoices
- Pending invoices
- Overdue invoices

For unpaid invoices, a countdown timer should start automatically based on the client's payment terms. The system should send automatic reminder emails 2–3 days before the payment deadline.

✓ **Stock Monitoring**

The system should allow BAJ to track weekly stock information.

Each week, BAJ should enter:

- Initial stock available at SCDP
- Total quantity delivered during the week
- Remaining stock

This helps track distribution activity.

✓ **Activity Tracking Dashboard**

The BAJ dashboard should show:

- Orders pending validation
- Upcoming deliveries
- Deliveries completed
- Payments pending
- Overdue payments

✓ **Weekly Automatic Report**

At the end of each week, the system should automatically generate a weekly activity report showing:

- Total quantity sold per product
- Total number of orders
- Total deliveries completed
- Initial stock at SCDP
- Remaining stock
- Payments received
- Payments pending
- Overdue payments

This report should be automatically sent by email to BAJ management.

✓ **Email Automation**

The platform should send automatic emails in the following situations:

1. New client order received
2. Order validation
3. Order modification
4. Order rejection (with explanation)
5. Delivery confirmation
6. Invoice sent
7. Payment reminder (2–3 days before deadline)

✓ **Security**

- Each client must have secure login credentials.
- Clients must only see their own orders and invoices.
- Only BAJ administrators can access the full system
